

Austin Townsend

townsendaustin50@gmail.com | 702-250-5908 | Mesa, AZ | github.com/Pancakeshack

Skills

Languages: Go, Kotlin, Java, SQL, TypeScript, Swift

Frameworks: Spring Boot, React, Jetpack Compose, SwiftUI

Cloud & DevOps: AWS (IoT Core, ECS, Lambda, DynamoDB, CDK), Docker, GitHub Actions

Observability: OpenTelemetry, Grafana, Prometheus, Splunk

Protocols: REST, gRPC, WebSockets, MQTT, BLE

Experience

Software Engineer, Jenius Bank (Company Closed)

September 2025 – January 2026

- Redesigned a credit decisioning flow using Kotlin functional interfaces and sealed types, integrating into a gRPC microservices environment, reducing implementation time for new credit strategies by 30% and decreasing runtime bugs
- Automated validation of credit policies by developing an integration test suite with Postman, significantly reducing manual regression testing overhead
- Established a standardized feature flagging lifecycle using Azure App Configuration for a Java/Kotlin Spring Boot MVC application to enforce removal requirements, minimizing technical debt and streamlining feature releases

Software Engineer, SNOOZ

September 2023 – September 2025

- Developed a modular monolith REST API in Go for a content streaming service and device management, using net/http and Postgres, supporting ~100,000 MAU
- Architected an IoT backend service leveraging AWS IoT Core, SNS, SQS, and Redis, implementing a Go based message processor using Goroutines to synchronize device states via WebSockets
- Developed an internal admin dashboard using React, TypeScript, and React Router, implementing granular access control logic across both the frontend UI and backend API middleware.
- Defined MQTT message architecture for new IoT hardware in collaboration with firmware engineering teams
- Implemented a CI/CD pipeline using GitHub Actions for automated testing and deployment of Go services to AWS ECS
- Configured telemetry for backend services using OpenTelemetry, Grafana, and AWS CloudWatch to ensure system observability
- Automated weekly marketing analytics reporting via serverless AWS Lambda functions and Go
- Architected native Android and iOS client layers (Kotlin/Swift) using Clean Architecture and MVVM to integrate BLE controls and consume IoT APIs for 4 connected products.

Projects

Distributed Systems Reading Group

Organizer

- Lead monthly engineering discussions on white papers (BigTable, Chubby, Kafka, etc) and build technical demos to visualize distributed concepts

Swift MapReduce Implementation

github.com/Pancakeshack/swift-map-reduce

- Developed a high performance MapReduce implementation based on the Google paper in Swift using Task Groups and AsyncStream to maximize concurrency
- Achieved 100% CPU utilization across 7 cores, processing an 8 million line dataset in 30 seconds

Education

University of Colorado, Boulder – MS in Computer Science

March 2025

Western Governors University – BS in Software Engineering

Aug 2023
