

Jim Dong

jd2695@nyu.edu | New York City | US Citizen

Skills

Languages: Java (Core, Swing, JavaFX), C# (.NET), Python, Bash, T-SQL, HTML/CSS

Backend & Infra: Jenkins, Gradle, Ansible, RabbitMQ, Protobuf, Red Hat Enterprise Linux, Windows Server

Data & Cloud: Microsoft SQL Server, PostgreSQL, AWS (S3, RDS, Lambda)

Monitoring & Tooling: Grafana, Prometheus, YourKit, Wireshark, Eclipse, VSCode, Microsoft Copilot, Bloomberg DAPI, ExcelDNA

Experience

Proprietary Trader & Developer, Self-Employed – New York, NY Sept 2024 – Nov 2025

- Built a custom JavaFX-based application with visualization modules for option chain data, integrating historical volume and open interest analytics to support derivatives trading decisions.
- Created a real-time pre-market volume scanner with market-cap filters to surface the most active stocks for trading opportunities.

Senior Software Engineer, RiskVal Financial Solutions – New York, NY Aug 2016 – Aug 2024

- Guided a 5-person team through a 6-month project to completely refactor the flagship product (written in Java) to MVC standards, resulting in cleaner code and fewer bugs, which sped up the development time for new features and enhancements.
- Led a complete overhaul of the Excel Add-in product (written in C#), simplifying it by reducing user-defined functions from over 200 to 4 and cutting the code from 30k lines to 9k lines, while maintaining backwards compatibility, significantly shortening the trader learning curve by aligning the API with familiar Bloomberg Excel signatures.
- Optimized the flagship product to load up to 40% faster with fewer CPU spikes while using up to 60% less memory, as profiled by YourKit, by reusing common objects and implementing lazy loading.
- Collaborated in a multi team effort to develop a unified CI/CD pipeline using Jenkins covering Gradle Java code building, UAT server provisioning, full workflow regression testing, and production releasing, resulting in 3x the daily feature (bugs, enhancements, SOWs) release capacity for the DevOps team.
- Designed Grafana dashboards for support and business teams to track metrics on a product's CPU and memory usage, as well as the client's usage of the product, enabling proactive client support and business engagement.
- Implemented hundreds of new features, enhancements, and bug fixes across three different products based on feedback from business teams and clients in an agile weekly release cycle.
- Created bash scripts to automate daily backend jobs, which collect market data, perform analytical calculations, and generate reports for clients.

Associate, ABA Electronics – New York, NY Feb. 2015 – July 2016

- Enhanced the inventory management program (written in Java) to display product sales summary information and estimated market price range of a product which led to 25% increase in sales volume.
- Set up a system that integrated the printing of invoice and shipping labels with the inventory management software which reduced the order processing time by 25%.

Education

New York University (NYU)

May 2016

Bachelor of Science in Computer Engineering
