

Claudio Buzi

Software Engineer | Cloud & AI Architect | Distributed Systems

Italy · Italian Citizenship · buziclaudio@gmail.com

Professional Summary

Software Engineer with experience building enterprise-grade full-stack solutions using Java, Spring, Angular, and modern cloud technologies (AWS, Docker, MongoDB, SQL). I design, develop, and maintain applications that combine solid backend architectures with intuitive frontend design.

I specialize in enterprise-grade and mission-critical systems, with a strong focus on distributed architectures, cloud-native solutions, and real-time data processing. My background spans defense, public-sector, and large-scale enterprise environments, with hands-on experience in Cloud- and AI-oriented architectures focused on scalability, performance, and system reliability.

Professional Experience

Software Engineer — Tinexta Defence / Leonardo S.p.A. (2025 – Present)

Currently working as a consultant for Leonardo S.p.A., contributing to the development of mission-critical avionics systems, specifically a software solution in the field of Air Traffic Management (ATM). The system is composed of multiple interconnected components that exchange live operational data through both TCP and UDP socket communication. Given its real-time nature, performance optimization using multithreading techniques is critical to ensure low-latency data processing and high responsiveness. Built as a high-performance distributed architecture, the solution is designed to handle significant data throughput with minimal delay, enabling efficient interaction between critical modules of the ATM system.

Full Stack Developer — Accenture / Ministry of the Interior (2023 – 2024)

Design, development, and testing of SPI (Sportello Unico Immigrazione), a large-scale platform supporting the issuance and management of residence permits for foreign citizens in Italy. The system also manages Civic Training sessions for the Integration Agreement and Italian language tests for long-stay permits. The solution is structured into ~40 functional streams and is primarily used by Prefectures, with additional users in Police Headquarters and Territorial Labor Inspectorates.

Worked end-to-end on both backend and frontend, contributing to the delivery of new features and maintenance in a microservices-based Java/EE ecosystem.

Developed REST APIs in Java with Spring (Spring Boot), leveraging core modules for dependency injection, configuration, layered architecture (Controller/Service/Repository), and clean separation of concerns.

Designed and maintained complex relational models and integrations using MySQL, managing highly connected entities and data consistency across services.

Authored, optimized, and fixed multiple SQL Stored Procedures, supporting business-critical workflows and performance-sensitive queries.

Collaborated on functional analysis and testing activities, including integration checks across services and validation of end-to-end flows for institutional users.

Full Stack Developer — Solving Team / APEIRON (2022 – 2023)

Development of Pitagora, a decision-support platform featuring a common core dedicated to ingesting, manipulating, and analyzing large volumes of data. The platform is organized into modular sections called "theorems", each implementing customer-specific business logic. The solution is built in a Java/EE microservices architecture, with an Angular frontend used to manage Front Office and Back Office operations.

Designed, set up, and developed both backend and frontend components, delivering end-to-end features from API to UI.

Built REST services using Spring (Spring Boot), using Spring's ecosystem to structure the application (controllers/services), manage configuration, validation, and dependency management, enabling scalable and maintainable microservices.

Implemented data processing and business logic inside theorem modules, integrating ingestion flows with analysis features exposed to the UI.

Chose and integrated MongoDB as the database to handle high data volumes and dynamic, non-fixed schemas, ensuring flexibility for variable structures while keeping data queryable and reusable across the platform.

Contributed to platform modularization and maintainability, aligning backend services and Angular UI modules for consistent Front/Back Office user workflows.

Additional responsibilities (Team Lead): After a few months, promoted to team leader. Coordinated feature delivery end-to-end, acting as main point of contact with the client, defining technical direction (design/architecture) and distributing tasks across the team.

Education & Certifications

BSc in Computer Science - Sapienza University of Rome (2020 - Present)

Certified Professional in PASS Development (2024)

KEY HIGHLIGHTS

- Mission-critical avionics systems
- Real-time distributed architectures
- Cloud & AI-ready system design
- High-performance and low-latency systems

TECHNICAL SKILLS

Cloud & Architecture

AWS, Docker, Kubernetes, CI/CD, High Availability

AI & Data

AI-ready architectures, AI Agents, Python, data pipelines

Backend

Java (8-21), Spring Boot, Microservices, Multithreading, REST APIs

Frontend

Angular, TypeScript, HTML, CSS

Databases

MySQL, MongoDB, PostgreSQL, Elasticsearch

DevOps

Jenkins, Git, Maven
