

PROFESSIONAL SUMMARY

Java Backend Engineer with **3+ years of experience** building and optimizing **high-availability backend services and RESTful APIs** using **Java 17, Spring Boot 3.x, Spring Security, and relational databases (PostgreSQL/MySQL)**. Strong track record delivering **production-ready microservices**, improving performance through **query tuning, indexing, caching patterns, and connection pooling**, and implementing secure authentication using **JWT and OAuth 2.0 patterns**. Hands-on experience deploying and operating services on **AWS (EC2, RDS, S3)** with **CI/CD automation**, strong testing discipline (**JUnit/Mockito**), and pragmatic engineering practices (clean architecture, SOLID, code reviews). Known for building maintainable systems with **reliable error handling, logging, monitoring/observability mindset, and incident-focused debugging**.

CORE TECHNICAL SKILLS

Languages: Java 17, JavaScript (React), TypeScript (working knowledge), Node.js (basic), Python (basic)

Backend: Spring Boot 3.x, Spring MVC, Spring Security, Spring Data JPA, Hibernate, REST APIs, Microservices, Layered Architecture

Security: JWT, OAuth 2.0 patterns, RBAC, BCrypt, Secure API Design, Input Validation, Least Privilege

Databases: PostgreSQL, MySQL, H2, Schema Design, Normalization, Indexing, Query Optimization, Transactions, Connection Pooling

DevOps/Cloud: AWS (EC2, RDS, S3, Lambda), Docker, GitHub Actions, Jenkins, Git/GitHub, Deployment Automation

API & Integration: Swagger/OpenAPI, API Versioning, Rate Limiting concepts, Pagination, Idempotency, Error Standards

Testing/Quality: JUnit 5, Mockito, TDD mindset, Unit/Integration Testing, Postman, Test Coverage, Regression Testing

Tools/Methods: Maven/Gradle, IntelliJ IDEA, Agile/Scrum, Code Reviews, Design Patterns, Clean Code, SLF4J/Logback

PROFESSIONAL EXPERIENCE

MyZ Math Tutor — Founder & Backend Engineer | Los Angeles, CA (Part time)

Apr 2024 – Present

- Architected and shipped a **production backend platform** using **Java 17 + Spring Boot 3.2 + MySQL**, designed for real usage and operational stability, consistently supporting **100+ concurrent users** with **99.5% uptime** and reliable request handling under peak loads
- Built and maintained a **REST API suite (20+ endpoints)** for authentication, user onboarding, content delivery, progress tracking, and basic analytics; implemented consistent response models, pagination patterns, and validation to reduce client-side failures and improve API usability
- Implemented secure authentication and authorization using **Spring Security + JWT + RBAC**, including password hashing (**BCrypt**), role-based route protection, token validation filters, and secure access patterns aligned with common backend security expectations
- Led performance optimization across database + API layers by applying **indexing strategies, query rewrites, and connection pooling**, reducing average response time from **~800ms to ~120ms** and improving page/API responsiveness without overengineering
- Designed a clean relational schema with proper **constraints, relationships, normalization**, and practical tradeoffs for reporting and feature growth; improved data integrity and reduced edge-case bugs caused by inconsistent records
- Implemented production-grade **exception handling and logging** using **SLF4J/Logback**, standardizing error payloads and enabling faster root-cause analysis during incidents and customer-reported issues
- Automated build, test, and deployment using **GitHub Actions CI/CD**, enforcing pre-merge checks (tests/lint/build), reducing manual release effort, and enabling repeatable deployments for quick hotfix turnaround
- Deployed services to **AWS (EC2, RDS, S3)** with environment-based configuration, secrets handling approach, and operational routines (restart strategy, basic health checks), ensuring predictable releases and fewer downtime events
- Developed comprehensive automated tests using **JUnit 5 + Mockito** (unit + service layer validation), achieving **85%+ coverage** on core modules and reducing regressions during feature delivery and refactors

Infosys — Associate Software Developer (Backend / Microservices)

Sep 2024 – Oct 2025

- Developed and enhanced **Spring Boot microservices** in an enterprise environment, implementing REST endpoints, service-layer business logic, and integration flows aligned with real delivery constraints (sprints, release windows, QA sign-offs)
- Implemented backend features including **request validation, error handling standards, and transactional workflows**, improving consistency across services and reducing production errors caused by invalid inputs or missing edge-case handling

- Built and maintained integration points between internal services and external dependencies, ensuring stable request/response contracts and applying defensive coding practices to reduce failure propagation in distributed workflows
- Created and expanded automated testing using **JUnit and Mockito**, writing unit tests for critical business logic and integration tests for key API flows to improve confidence during deployment and reduce escape defects
- Participated in **Agile ceremonies** (planning, grooming, daily standups, retrospectives), translating requirements into implementable tasks, estimating work realistically, and delivering incrementally with clear acceptance criteria
- Supported production readiness by partnering with QA and DevOps on deployment checklists, verifying configuration correctness, reviewing logs for anomalies, and resolving bugs discovered during staging/UAT cycles
- Performed peer **code reviews** focusing on correctness, readability, maintainability, and security basics (auth checks, validation, sensitive data handling), contributing to higher overall code quality
- Diagnosed and resolved performance and reliability issues using logs, metrics, and targeted debugging; improved stability by fixing root causes instead of patching symptoms
- Collaborated cross-functionally with frontend engineers and QA to finalize API behavior (status codes, validation rules, payload structure), reducing integration churn and rework during release cycles

Revature — Java Full Stack Developer (Backend-Focused)

Jun 2023 – Sep 2024

- Built backend services for an e-commerce platform using **Java + Spring Boot + PostgreSQL**, delivering production-style REST APIs for catalog, users, orders, and secure access workflows with clean separation of concerns
- Implemented microservices-oriented patterns (service boundaries, DTO contracts, controller/service/repository structure) and ensured maintainability through consistent naming, code organization, and reusable components
- Designed PostgreSQL schemas with practical normalization, constraints, and indexing; improved query performance through **EXPLAIN-driven tuning**, index selection, and selective denormalization when justified by access patterns
- Implemented secure access control using **Spring Security with JWT** and OAuth-style flows where relevant; enforced role-based permissions and protected sensitive endpoints from unauthorized access
- Improved performance with pragmatic strategies such as query tuning, indexing, and caching patterns (where appropriate), achieving measurable response time improvements in common workflows and reducing database load
- Built automated testing coverage using **JUnit + Mockito** across service and controller layers; added integration tests for key endpoints to validate request/response contracts and prevent regressions
- Integrated CI/CD style workflows using Git-based branching, automated builds, test runs, and deployment steps to emulate real engineering delivery practices used in U.S. teams
- Applied engineering best practices including **SOLID principles**, design patterns (MVC, Repository, Service Layer), and refactoring for clarity; reduced technical debt and improved onboarding readability
- Worked across frontend-backend integration needs as required (API alignment, payload shape changes, error handling contracts), minimizing integration defects and improving overall delivery speed

Insight Enterprises — Frontend Developer (React)

May 2022 – Jun 2023

- Developed and maintained scalable, responsive web applications using **React.js, JavaScript (ES6+), HTML5, and CSS3**, ensuring cross-browser compatibility and consistent UI/UX standards.
- Collaborated with **product managers, UX designers, and backend engineers** to translate business requirements into functional, user-centric frontend solutions.
- Optimized application performance by implementing **code-splitting, reusable components, and state management best practices**, reducing page load times by 25%.
- Integrated RESTful APIs and handled asynchronous data flows to deliver real-time data updates, improving overall application reliability and user engagement.
- Participated in **code reviews, debugging, and Agile sprint cycles**, contributing to a **30% reduction in UI-related defects** and faster feature delivery.

Acer America — Full Stack Web Developer (Intern / Contract)

Dec 2021 – Apr 2022

- Supported full-stack feature delivery by implementing small enhancements and bug fixes across UI and backend integration points under guidance of senior engineers
- Assisted with REST API integration and testing, validating endpoints using tools like Postman and confirming expected responses for front-end flows
- Contributed to codebase maintenance by addressing tickets, updating components, and improving reliability through incremental fixes
- Participated in team workflows including standups, task updates, and documentation of work completed for visibility and handoff

- Collaborated with developers to align on requirements, clarify acceptance criteria, and ensure changes matched expected behavior
- Performed basic debugging and troubleshooting for defects, reproducing issues, isolating root causes, and implementing fixes safely
- Strengthened Git workflow habits through branch-based work and PR reviews, improving version control discipline and traceability
- Supported testing cycles by validating fixes in staging-like environments and confirming no regressions in impacted modules
- Improved overall developer efficiency through documentation updates and cleanup tasks that reduced confusion in future updates

PROJECTS (SELECTED)

MyZ Math Tutor (Live Production Platform)

- Built a scalable backend using **Spring Boot 3.2, MySQL, JWT, AWS EC2/RDS/S3**, and CI/CD automation
 - Delivered reliable API performance through indexing, query optimization, and connection pooling; implemented strong auth and role protection
- Live: <https://myzmathtutor.live>

E-Commerce Backend Platform

- Implemented backend APIs for authentication, product catalog, and order processing using **Java, Spring Boot, PostgreSQL, JWT**
 - Applied service-layer architecture, exception handling, and automated testing to match real backend engineering standards
- GitHub: github.com/olabugsy

Resumox Backend API

- Spring Boot REST API with authentication, CRUD operations, and deployable app setup for demo and usage scenarios
- Live: <https://resumox-backend--olawalealex-oni.replit.app/login>

Shopify Integration APIs

- Built integration endpoints for inventory and order workflows supporting business sites and third-party service connectivity
- MyZPetsCare: <https://myzpetscare.com> | MyZTechZone: <https://myztechzone.com>

EDUCATION

Master of Science - University of Lagos / Transportation Planning & Management / 2014 – 2016

Bachelor of Science - university of lagos / Physics / 2003- 2010

CERTIFICATIONS / TRAINING

NEBOSH International General Certificate (IGC) - UK

Revature Java Full Stack Developer Training Program
