

SWAPNIL SANJAY JOIJODE

Full-Stack Data Analyst | SQL, Power BI & ETL Automation

Melissa, Texas (open to Relocation) | +16179619478 | swapniljoijode22@gmail.com | [Git](#) | [LinkedIn](#)

PROFESSIONAL SUMMARY

Full-stack data analyst with ~3.5 years supporting risk, HR/payroll, and retail stakeholders through SQL-driven reporting, dashboarding, and process automation. Proven ability to build and optimize departmental datasets and Power BI models over SQL Server and flat-file sources, reducing refresh times, stabilizing scheduled loads, and improving trust in standard and ad-hoc reports used for business decisions. Previously supported structured portfolio risk reviews by running Excel-based VaR simulations across ~100 assets and standardizing risk summaries so committees could focus on the highest-exposure positions. Seeking a hybrid Full-Stack Data Analyst role where I can leverage SQL, Power BI, and ETL/orchestration tools to improve data quality, automate reporting workflows, and deliver meaningful insights for business and risk teams, driving operational excellence.

PROFESSIONAL EXPERIENCE

Data Analyst & Power BI Developer

Vision Group Retail. (Hauppauge, NY)

August 2024 – November 2025

- Optimized Power BI model size from ~10 GB to under 1 GB and reduced refresh time from ~10 to under 2 minutes by refactoring SQL filters and Power Query merges over SQL Server and flat-file sources, enabling regional teams to use same-day performance reports instead of waiting through slow or failed loads.
- Configured incremental refresh in Import mode on multi-GB datasets, turning unstable daily refreshes into predictable scheduled updates so stakeholders could rely on fixed refresh times when preparing operational and performance reviews.
- Designed a multi-page Power BI report on planogram-derived data for 200+ store groups, extending space and item-share KPIs across store, group, and manufacturer so merch and category owners could base planogram discussions on consistent metrics rather than ad-hoc spreadsheets.
- Built a privacy-preserving employee engagement dashboard on Microsoft Forms survey data that highlighted communication and workload concerns at team level, helping HR plan targeted follow-ups instead of broad, generic guidance.
- Established a shared semantic model and KPI data dictionary for space share, item share, and store groups, ensuring new client reports reused standard definitions, reducing meeting time spent reconciling conflicting numbers and improving documentation for future enhancements.

Data Analyst

TekSolve IT Solutions (Boston, USA)

August 2023 – December 2023

- Reduced HR/payroll report error rate from 0.58 to 0.18 across three monthly cycles by tracing mismatches in terminations, salary changes, and duplicate employee IDs back to source extracts and transformation logic, increasing confidence in headcount and pay reports at sign-off.
- Assisted in setting up repeatable Python-based data checks on HR and payroll extracts, allowing payroll teams to identify missing, terminated, or duplicated employees earlier in the cycle instead of discovering issues right before pay runs.
- Contributed to a basic star-schema Power BI model over HR and payroll feeds, enabling managers to review department-level employee and pay information directly in reports, reducing reliance on one-off Excel pulls and supporting more consistent monthly reporting.

Senior Business Analyst

Quantum Phinance Consulting Pvt. Ltd. (Mumbai, MH)

January 2020 – December 2021

- Ran Excel-based VaR and Monte Carlo simulations across ~100 mixed assets to highlight 10 positions breaching portfolio thresholds, helping the risk committee concentrate its reviews on the most exposed loans and investments.
 - Prepared standardized risk summaries with scenario-based loss ranges on flagged positions, giving committee members a single comparable view to discuss whether to terminate, hedge, or pursue recovery on specific assets instead of relying on scattered ad-hoc files.
 - Documented ~20 reporting workflows in BRDs, FRDs, and SOPs, reducing 4–5 clarification cycles per change request between risk, finance, and development teams and improving traceability for reporting changes.
 - Clarified data and reporting requirements for 3–4 recurring risk and MIS reports, cutting rebuilds and enabling monthly packs to go out more consistently with fewer last-minute corrections, supporting smoother month-end processes.
-

EDUCATION

School of Professional Studies, Clark University.
Masters in Data Analytics (Information Management).

Worcester, MA, United States
January 2022 – December 2023

Shivajirao S. Jondhale College Of Engineering, Mumbai University.
Electronic and Telecommunication Engineering.

Mumbai, MH, India
August 2015 – July 2019

PROJECTS

Multi-Channel Brand Space Performance Analytics Dashboard | *[Power BI, Dataflows, DAX, SQL, Data Modeling]*:

- Built a multi-page Power BI dashboard with partitioned dataflows over 12 months of brand-space data at the grain (store, brand, category, channel, date), using daily partitions for current month and monthly partitions for history to keep refresh times within operational SLAs.
- Hand-coded MTD, QTD, and YTD DAX logic to match business reporting rules and showed how merch and category teams could systematically flag under-supported priority brands and plan data-driven space and promotion adjustments.

OTT User Churn Prediction (Case Study) | *[Python (pandas, numpy, sklearn, boto3), AWS (Glue, Sagemaker, S3)]*:

- Designed local Python and AWS Glue ETL over synthetic OTT usage, billing, and tenure data, engineering features such as watch time, late-payment ratio, and membership type at user level to support churn modeling.
- Trained a logistic regression model with cross-validation, achieving ~0.75 true positive rate at ~0.20 false positive rate in the top-risk segment, and exposed scores via a Flask API on AWS for simulated real-time scoring.
- Outlined how a production deployment could prioritize outreach to high-risk users so retention teams focus interventions on segments with payment issues and declining usage rather than applying generic offers.

School Academic Record & Student Performance Analysis (Case Study) | *[Python (pandas, numpy, sklearn)]*:

- Used a 70/30 train-test split to train Random Forest and XGBoost models on attendance, assessment, and behavior data to predict both grades and pass/fail outcomes.
- Found Random Forest performed best on the classification target and defined “at-risk” students using a probability threshold, illustrating how schools could plan earlier interventions instead of waiting for term-end failures to surface.

SKILLS

Analytics & Modeling: Statistical analysis | Predictive modeling (logistic regression, Random Forest, XGBoost) | Experimentation and A/B-style analysis | Time-series trend analysis | Forecasting | Risk Assessment | Statistical modeling | Data mining techniques | Analytical

Business Intelligence & Reporting: Power BI (Desktop, Service, DAX, Power Query, Semantic Models) | Tableau | Dashboard and report design | KPI definition | Time-intelligence calculations | Advanced Excel (pivot tables, Power Pivot, macros, large datasets) | PowerPoint for executive and sales-style performance decks | Data visualization | Presentations

Data & Databases: SQL Server | Snowflake | Databricks SQL | SQL for ETL and data validation | SSIS | ETL | Star & snowflake schema modeling | Dataflows | Incremental refresh & partitioning | Database management | SQL Server Reporting Services | Data Quality

Programming: Python (pandas, numpy, sklearn) | Data cleansing and reconciliation pipelines | Basic AWS experience (Glue, S3, Sagemaker for case studies)

Methods & Collaboration: Business Requirements gathering | User story definition | Agile tools (Azure DevOps, JIRA) | BRDs, FRDs, SOPs | Cross-functional collaboration | Manage multiple projects | Attention to Detail | Verbal communication skills | Maintain Confidentiality | Operational Policies | Continuous Improvement | Troubleshooting
