

CANDIDATE NAME: Midhat Zahra
CONTACT NO: +971564752812
ADDRESS: Al Karama, Dubai
VISA STATUS: Family visa
NATIONALITY: Pakistan
EMAIL: zahramidhat80@gmail.com

Full Stack Software Engineer | 4+ Years Experience

SUMMARY

- 4+ Years of Full Stack Expertise: Advanced proficiency in Angular, TypeScript, .NET, and NestJS.
- Performance Optimization: Improved application response times by 25% through advanced frontend and backend tuning.
- Data Leadership: Led the delivery of real-time visualization systems, slashing data latency by 30%.
- Modern DevOps: Deep experience in Agile methodologies, automated testing, and CI/CD integration.

TECHNICAL SKILLS

Programming Languages: JavaScript, TypeScript, Python, Java, C#
Frameworks/Libraries: Angular, NodeJS
Databases: MySQL, MongoDB, PostgreSQL, Firebase
Web Technologies: HTML, CSS, RESTful APIs, GraphQL
DevOps/Cloud: Docker, GCP, AWS, Azure
Version Control: Git
Testing: Unit tests, integration test

ORGANIZATION DETAILS (Please modify according to your profile and add all organization details)

Organization	Designation	Duration
FinTech Hive at DIFC (Finzone Technologies) – Dubai, UAE	Full-Stack Developer & Technical Team Lead	(Nov 2024 to Present)
Emirates Business Management - Dubai	Software Development Engineer II	(December 2023 to Oct 2024)
GagaMuller Technology- Remote Ireland	Software Engineer II	(December 2021 to Nov 2023)

PROJECTS DETAILS

Organization:” FinTech Hive at DIFC (Fin zone Technologies) – Dubai, UAE”
Duration: November 2024 – Present

Project Detail	Technologies Used
Title: Accounting and Invoicing Software Client: UAE Freezone Financial Clients Domain: Banking & Financial Services / Accounting Project Type: Web Application / ERP Team Size: 8 Role: Full-Stack Developer & Team Lead Period	Frontend: Angular, Prime NG Backend: NestJS , Scheduled Scripts (Recurring Invoices) Database: Postgres SQL Notifications: SMTP (Email Alerts) Version Control: Git, CI/CD Methodology: Agile Cloud Services: GCP (Google Cloud Platform)

Project Description:

The Accounting and Invoicing Software is a full-featured, cloud-based financial platform tailored for SMEs and financial institutions. It supports invoicing, customer and bank account management, automated general ledger entries, recurring billing, and compliance with UAE VAT regulations. The system is modular, scalable, and designed for real-time financial operations. As the technical team lead, I oversee architecture, development workflows, and feature planning while also contributing directly to full-stack development.

Roles and Responsibilities:

Leadership & Collaboration:

Team Leadership: Direct a cross-functional team of 8 developers; managing sprint execution, project roadmaps, and technical QA via Agile methodologies.

Mentorship: Conduct rigorous code reviews and architect deployment strategies to ensure high-quality, scalable codebases.

Stakeholder Management: Align technical delivery with business goals and regulatory requirements through proactive stakeholder collaboration.

Architecture: Following **mono repo** architecture to avoid reptation and writing manageable and clean code.

Technical Execution (Full Stack)

Frontend Engineering:

Multi-Tenant UI: Architected a responsive Angular interface for gold retailers to manage complex accounts across multiple branches and parent companies.

Real-Time Data: Implemented live balance tracking and interactive financial dashboards using dynamic charts to visualize branch-specific performance.

Advanced Ledger UI: Developed comprehensive transaction history modules with multi-parameter filtering (date, branch, company).

Security: Engineered frontend RBAC (Role-Based Access Control) logic to ensure secure, tiered access to sensitive financial data.

Backend Engineering:

Core API Development: Built scalable NestJS REST APIs RESTful APIs supporting centralized management for multi-company operations.

Schema Design: Optimized Postgres SQL Server architectures to maintain data integrity for high-volume financial transactions and reporting.

Data Aggregation: Developed backend logic to consolidate disparate branch data into unified real-time financial reports.

Integrations: Seamlessly integrated third-party APIs to extend financial reporting and accounting capabilities.

Google Identity Platform: For authentication and authorization.

Database & Optimization: Optimized SQL Server schemas for high-integrity financial ledger tracking and transaction recording.

Automation: Integrated automated email alert systems for payment tracking and tax deadlines, improving operational efficiency.

DevOps & Collaboration

Agile & Quality: Delivered key features within Agile sprints, ensuring system reliability through rigorous unit testing and debugging.

Documentation: Authored detailed technical documentation for system architecture and multi-branch operational workflows.

Organization: “Emirates Business Management Dubai, (UAE)”

Duration : December 2023 - October 2024

Project #1

Project Detail	Technologies used
Title: AML (Anti Money laundering) Client: Diverse Global Financial Clients Domain: Banking & Financial Services Project Type: Web Application / ERP Sub module Team Size: 14 Role: Full Stack Developer	Frontend: Angular, Prime NG Backend: .NET Core Database: Microsoft SQL Server Data Sources: External websites like EU, OFAC, UN, UAE PEP, and WIKI Alerts and Notifications: Email notifications using SMTP for sending alerts Version Control: Git Methodology: Agile Cloud Service: Azure

Project Description:

The AML (Anti Money Laundering) system is a web-based solution built for financial institutions to comply with global anti-money laundering regulations. It automates customer screening by fetching data from sources such as EU, OFAC, UN, UAE PEP, and WIKI, then cross-referencing it with customer records stored in a Microsoft SQL Server database. The frontend, developed in Angular, allows users to manage screening results, while the Node.js backend handles data fetching, processing, and scheduled updates every 24 hours. The system also sends automated email alerts to notify compliance officers of potential risks. The project, developed by a team of 14 using Agile methodologies, ensures timely updates and Scalability.

Roles and Responsibilities:

Technical Execution (Full Stack)

Frontend Engineering: Engineered complex Angular modules for financial reporting, tax automation, and role-based dashboards, ensuring full responsiveness.

Security: Engineered frontend RBAC (Role-Based Access Control) logic to ensure secure, tiered access to sensitive financial data. Azure auth services were used for Authentication and Authorization.

Backend Engineering: Developed robust .NET REST APIs to power accounting automation and built a custom recurring billing engine.

Project #2

Project detail	Technologies used
Title: Gold Seller ERP System Client: UAE Gold Sellers Domain: Financial Services Project Type: ERP Team Size: 14 Role: Full Stack Developer	Frontend: Angular, Tailwind Backend: .NET core Database: Microsoft SQL Server Version Control: Git Methodology: Agile Cloud Services: Azure

Project Description:

The Gold Sellers ERP is a web-based application designed to assist gold sellers in managing their financial operations efficiently. It features an Account Balance Module for tracking account balances and a Statement of Account Module that provides detailed transaction histories. The application incorporates data visualization tools to present key metrics and trends through interactive charts and graphs, allowing users to easily analyze their financial performance. Built using Angular for the front end and ASP.NET for the back end, the system integrates with Microsoft SQL Server for secure data storage and retrieval, enabling users to access real-time insights into their accounts. Overall, the application streamlines business processes, enhances operational efficiency, and improves customer service.

Roles and Responsibilities:

Multi-Tenant Architecture: Engineered a responsive Angular and ASP.NET platform enabling gold retailers to manage financial accounts and real-time balances across complex multi-branch and multi-company hierarchies.

Data Engineering & Visualization: Designed robust SQL Server schemas to consolidate high-volume transaction data into interactive financial dashboards, featuring advanced filtering and real-time reporting metrics.

Security & Integration: Implemented secure RBAC (Role-Based Access Control) for sensitive financial data and integrated third-party APIs to extend accounting and reporting functionalities.

Agile Lifecycle Management: Led the end-to-end development cycle—from requirement gathering in Agile sprints to unit testing and technical documentation—ensuring 100% system reliability and scalability.

Organization : "GagaMuller Technology"

Duration : December 2021 to November 2022

Project #1

Project Details	Technologies used:
Title: WayLoader Client: Company Product Domain: Construction Project Type: SaaS Team Size: 35+ Website Link https://www.wayloader.com/	Frontend: Angular, Prime NG for UI components. Backend: .NET Core Database: Postgres Sql Version control: Git Alerts and Notifications: Email (SMTP) Authenticator: Aws Cognito Methodology: Agile Cloud Services: Aws

Project Description:

This application is designed for managing construction projects with a robust architecture that integrates user roles, company-specific projects, and task management, all within a dynamic, map-based interface. The application is built using Angular (with TypeScript) for the front end, ASP.NET for the backend, and leverages cloud deployment on AWS using Azure DevOps.

Key Features and Modules:

Identity & Access Management (IAM): Engineered a dynamic RBAC (Role-Based Access Control) system with a granular user rights management module, ensuring secure, tiered access based on organizational hierarchies (Company > Project > Location).

Geospatial (GIS) Asset Visualization: Developed an interactive GIS mapping module to visualize construction sites. Integrated detailed architectural data, allowing users to drill down into project-specific layers such as floors, rooms, and sections via a geographical interface.

Project Planning & Task Orchestration: Built a multi-view Plan Loader module featuring custom workflow visualizations, including Stack Views for task management and Project Views for holistic roadmap tracking.

Real-time Collaboration: Implemented an integrated messaging and notification engine to facilitate seamless team communication and rapid issue resolution within the project context.

Roles and Responsibilities:

Dynamic UI Development: Architected responsive interfaces using **Angular** and **TypeScript**, leveraging **Prime NG** to deliver high-quality, consistent user experiences.

Complex State Management: Developed the "Plan Loader" module, engineering sophisticated **Stack and Project views** to streamline multi-tier task workflows.

Security & RBAC: Implemented granular frontend logic for **Role-Based Access Control**, ensuring secure and authorized feature visibility.

API Orchestration: Engineered scalable RESTful APIs using ASP.NET Core to handle complex business logic and real-time data processing.

Data Management: Optimized PostgreSQL database schemas for high-availability storage of GIS data, user identities, and project metadata.

Secure Authentication: Standardized system security by implementing JWT (JSON Web Tokens) for robust user authentication and data protection.

EDUCATIONAL QUALIFICATION

- Bachelors of Science in Software Engineering
University of Comsats, Islamabad, Pakistan
February 2018 – June 2022
