SUMMARY	Data Analyst with experience in designing ETL pipelines, building enterprise-grade dashboards, and delivering data products that support commercial sales, e-commerce, and operational decision-making. Specialized in SQL-driven analytics, Oracle-based data warehousing, and Power BI reporting within large-scale enterprise environments. Currently completing an M.S. in Analytics at Georgia Tech with a focus on computational data analytics.	
EDUCATION	Master of Science in Analytics – Georgia Institute of Technology Specialization: Computational Data Analytics Graduation date: Dec 2026 GPA: 3.8 Bachelor of Business Administration – University of Memphis Majors: Information Technology, Supply Chain Management May 2023 GPA: 3.96	
SKILLS	Languages: SQL, R, Python Analytics & BI: Power BI, Tableau, Google Analytics, Kibana Data Engineering & Platforms: Oracle, Databricks, SAP BW, Elastic Stack, Azure DevOps Tools & Automation: SSMS, Toad, Playwright, OpenRefine, Figma	
EXPERIENCE	International Paper	August 2025 – Present
	Data Analyst – Commercial Sales Enablement	
	- Develop and maintain SQL-based ETL pipelines to ingest and transform enterprise invoice data into the corporate data warehouse supporting financial and sales reporting. - Maintain and enhance Oracle stored procedures, materialized views, and legacy SQL pipelines feeding SAP BW, ensuring data reliability and performance for downstream analytics. - Lead month-end invoice data integration processes, validating data completeness and accuracy for financial close and executive reporting. - Design and deploy Power BI dashboards monitoring application engagement, sales performance, and operational productivity across commercial teams.	
	International Paper	May 2023 – July 2025
	Business Analyst – E-commerce and Marketing, Customer Experience Services	
	- Built advanced SQL analytical queries using CTEs, window functions and pivots to evaluate user journeys, ordering behavior, and funnel performance across e-commerce platforms. - Created a Power BI report for manager-level analytics to evaluate a newly adopted kanban methodology, reporting time-in-state measures and work completion metrics. - Designed dashboards using Power BI and Google Analytics to track KPIs, usage statistics, adoption rates, predictive modeling, and profitability reporting allowing business users to make informed decisions on customer strategy. - Analyzed user interaction data and heat maps to identify high-impact features and collaborated with product owners to prioritize UX roadmap features. - Built Kibana dashboards to monitor and visualize error frequency and release quality to identify problematic version releases and unrealized bugs, decreasing user-reported bugs by 45%. - Led technical, visual, and procedural design efforts, including third-party API integration, to enable credit card acceptance for an E-Commerce application.	
	International Paper	June 2022 – May 2023
	Business Process Analyst	
	Developed a Power BI dashboard, extracting data from SAP via Theobald to display failed billing documents for all business units, allowing Account Executives to identify errors and recover missed revenue.	

- Created a ServiceNow dashboard to display KPIs (service level agreements, resolution times, and completion rates) along with weekly reports to support backlog resolution and ticket closure.
- Leveraged Excel macros and formulas to improve managers' metric reporting and consolidate processes for fixing tickets resulting in 50% lower time-to-complete.
- Collaborated on root cause analysis, debugging, and testing for a shipment diversion bot in Blue Prism RPA.
- Improved process for diagnosing SAP report errors by discovering and using more efficient SAP transactions, reducing completion times for some tickets by 40%.

International Paper

December 2021 – June 2022

Data Analyst Intern

- Designed dynamic reports to present KPIs (spend, savings, and TCO), providing sourcing teams with enhanced visibility into commodity pricing trends.
- Automated report generation using Power BI and Azure databases, migrating legacy Excel reports and reducing manual effort by 95% and increasing reporting efficiency.
- Led department sourcing initiative meetings, presenting dashboards communicating the strategic importance of KPIs with stakeholders on commodity pricing trends.
- Conducted spend and invoice audits using Excel, identifying over \$10,000 in overcharges against a subset of 5% of the total data for the spend category, showing about 15% overspending in a 2-million-dollar category

PROJECTS

Interactive Crime Map: Using Python, built a hex-grid spatio-temporal model over Atlanta crime data using Kernel Density Estimation to compute probabilistic safety scores and visualize interactive risk maps in Tableau.

Association Rule Mining: Implemented market-basket analysis to identify frequent itemsets and generate proof-of-concept product recommendations for e-commerce ordering optimization.

Heart Disease Prediction: Implemented Logistic Regression, Random Forests, Principal Component Regression and General boosting models, finding optimal parameter values and assessing model accuracy through cross validation, achieving a type II error of 10.77% for heart disease prediction.
